If the SMALL ENTITY is shown as YES, verify your current SMALL ENTITY status:

A. If the status is the same, pay the TOTAL FEE(S) DUE shown above.

Examiner, Art Unit 2435

DETAILED ACTION

Applicant amends claims 10 and 15. Claims 10-15 are presented for examination.

Continued Examination Under 37 CFR 1.114

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 24 February 2010 has been entered.

Response to Arguments

Applicant's arguments, see Remarks, filed 24 December 2009, with respect to claims 10-15 have been fully considered and are persuasive. The previous grounds of rejection have been withdrawn.

In particular, Applicant argues on page 8 of Remarks, "As discussed during the December 22 discussion, it is respectfully submitted that the portions of Schroeder relied on by the Examiner do not appear to disclose '(i) ... such that during operation an output from the first shift register is supplied to the input stage of the seconds shift register and the same output from the first shift register is supplied to an input of the first adder, and (ii) ... such that during operation an output of the second shift register is supplied to another input of the first adder' as now recited in claim 15." Claim 10 is similar in scope as to claim 15. The Examiner finds the arguments persuasive and the Examiner withdraws the previous grounds of rejection of claims 10-15.

Allowable Subject Matter

Claims 10-15 are allowed.

The following is an examiner's statement of reasons for allowance: The prior art, alone or in combination, does not teach nor suggest a data processing apparatus adapted for performing scramble processing of transmit data, the data processing apparatus comprising: a random number generating circuit to generate a random bit data train, said random number generating circuit being arranged such that (i) an output stage of the first shift register is directly coupled to an input stage of the second shift register and to the first adder such that during operation an output from the first shift register is supplied to the input stage of the second shift register and the same output from the first shift register is supplied to an input of the first adder, and (ii) an output stage of the second shift register is directly coupled to the first adder such that during operation an output of the second shift register is supplied to another input of the first adder; a data generator to generate bit data of a predetermined pattern and to supply the generated bit data of the predetermined pattern therefrom, said data generator being separate from the random number generating circuit; a second adder arranged to receive an output of the first adder and the transmit data and being operable to generate scramble-processed data therefrom; a first switch arranged to receive the scramble-processed data from the second adder and the bit data of the predetermined pattern from the data generator, said first switch being operable to select the bit data of the predetermined pattern at the time of synchronization processing of the transmit data

Art Unit: 2435

and to select the scramble-processed data when synchronization processing of the transmit data is not performed and to output the data selected.

The prior art, alone or in combination, does not teach nor suggest a data processing apparatus adapted for performing scramble processing of transmit data, the data processing apparatus comprising: a random number generating circuit to generate a random bit data train, said random number generating circuit having a first shift register, a second shift register, and a first adder, said random number generating circuit being arranged such that (i) an output stage of the first shift register is directly coupled to an input stage of the second shift register and to the first adder such that during operation an output from the first shift register is supplied to the input stage of the second shift register and the same output from the first shift register is supplied to an input of the first adder, and (ii) an output stage of the second shift register is directly coupled to the first adder such that during operation an output of the second shift register is supplied to another input of the first adder; a data generator to generate bit data of a predetermined pattern and to supply the generated bit data of the predetermined pattern therefrom; a switch arranged to receive an output of the first adder and the generated bit data of the predetermined pattern, said switch being operable to select the bit data of the predetermined pattern at the time of synchronization processing of the transmit data and to select the output of the first adder when synchronization processing of the transmit data is not performed and to output the data selected; and a second adder arranged to receive the transmit data and

Art Unit: 2435

the data selected outputted from the switch and being operable to generate scramble-processed data therefrom.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. See PTOL-892.
